1. INTRODUCTION

This is the Corrected Final Report on Increments A through G of the Energy Engineering Analysis Program (EEAP) at New Cumberland Army Depot (NCAD). This project has been conducted under the Norfolk District, Corps of Engineers Contract No. DACA 65-80-C-0014, by PRC Systems Services, Cocoa Beach, FL.

During Increments A and B, four modification projects were recommended for funding under the Energy Conservation Investment Program (ECIP). Increment G resulted in three recommended projects and Increment E determined the feasibility of a new, coal-fired central steam plant. Studies conducted during Increments C, D, and F concluded that none of the proposed work was economically feasible under applicable guidelines.

2. EXISTING ENERGY CONSUMPTION

Actual energy consumption at NCAD was determined from electricity billings and from fuel oil delivery records. Costs were taken from contracts and service agreements that were in force at the times the various increments were undertaken.

2.1 BASEWIDE ENERGY CONSUMPTION

Using conversion factors specified in the Army Facilities Energy Plan and prices in effect during the year, the following summarizes the total energy picture for fiscal year (FY) 83.

| Fuel | Consumption | Dollars | Source Energy Units |
|----------------------------|-----------------------------------|------------------------|-----------------------------|
| Electricity Fuel Oil No. 2 | 40,916,000 kWh 168,122 gallons | \$1,800,000 203,500 | 474,630 MBtu 23,320 MBtu |
| Fuel Oil No. 6 | 2,160,293 gallons | 1,966,000 | 323,370 MBtu |
| | | \$3,969,500 | 821,320 MBtu |

2.2 HISTORICAL FUEL CONSUMPTION

Table 1 shows the historical record of fuel consumption from FY 75 through FY 83 and projected consumption for the future. The projection assumes that energy conservation measures recommended during this contract will have been completed and that the other factors (including base mission) remain constant.

2.3 BUILDING TYPE: SOURCE ENERGY CONSUMPTION

Buildings were grouped into 10 categories for the purpose of this study. Using FY 80 as the base year, the building groups were subjected to computer analysis to determine the relative consumption of each category. The following listing summarizes the results.

| Gro | oup No. | <u>Title</u> | Total Floor Area (sq ft) | 1980 Consumption (Source MBtu) |
|-----|---------|--------------------------------------|-----------------------------|-----------------------------------|
| | I | Admin, Op, Trng | 365,200 | 34,800 |
| | 11 | Stor, Whse | 2,467,400 | 210,100 |
| | III | Rec, Clubs, Centers | 48,900 | 3,200 |
| | IV . | Mess Halls, Eating Estab | 30,200 | 4,400 |
| i | ٧ . | Clinic | 6,700 | 600 |
| | VI | Barracks, BOQ | 24,400 | 4,500 |
| | VII | Stores, Banks, Lib, Chap, Mus | 28,400 | 2,000 |
| | VIII | Svce Sta, Gar, Mot. P, Shops | 646,400 | 168,500 |
| | IX | Family Housing | 182,200 | 12,700 |
| | X | Other, Audited | 81,700 | 15,000 |
| | - | Other, Unaudited, Fuel Oil $^{ m 1}$ | | 58,900 |
| | - | Other, Unaudited, Electricity | 2 | 261,000 |
| | | | | |

¹In addition to the unaudited buildings, this item accounts for fuel oil to be saved because of base-initiated projects.

 $^{^2}$ In addition to note 1, this item includes outdoor lighting and all pumps, fans, machines, and other equipment that do not directly impact heating or cooling loads.

2.4 TYPICAL BUILDING ENERGY CONSUMPTION

Tables 2 through 11 show the consumption of energy for heating, cooling, and lighting for individual buildings (or zones of buildings). The arrangement of the buildings is by the 10 categories listed in 2.3. (Note: Lighting energy is measured at the site; heating and cooling energy is measured at the sources.)

3. INCREMENT A - BUILDINGS AND PROCESSES

The following measures were investigated in detail during Increment A. Those in the column on the left did not meet ECIP criteria or were rejected for other reasons. Those on the right have been incorporated into one or more ECIP project packages.

Exterior Wall Insulation
Exterior Roof Insulation
Domestic Hot Water (DHW) Timeclocks
DHW Temperature Setback
Exhaust Air Heat Recovery
Outside Air Economizer

Interior Wall Insulation
Interior Roof Insulation
Ceiling Insulation
Underfloor Insulation
Basement Wall Insulation
Personnel Door Weather Stripping
Bay Door Weather Stripping

3.1.1 ARCHITECTURAL/STRUCTURAL MODIFICATIONS. Work will consist of the following modifications to achieve improved energy conservation:

a. Wall Insulation.

- (1) R9 spray cellulose on buildings P1, P6, P7, P24, P28, P82, P83, P84, P85, and P88
- (2) R11 F/G batts on buildings P14, P54, P83, P84, P400, T526, and T528
- (3) R13 F/G batts on buildings P1, P62, P82, P83, P84, and P104
- (4) R17 F/G batts on buildings P79, P81, P102, P400, T524, and T526
- (5) R15 F/G batts on building P104

b. Ceiling Insulation.

- (1) R15 lay-in F/G batts in buildings P1, P83, and P84
- (2) R11 lay-in F/G batts in buildings P54, P79, P81, P83, P84, P85, and P400
- (3) R9 lay-in F/G batts in building P81
- (4) R13 lay-in F/G batts in building P104
- (5) R9 spray cellulose with mesh in building P28
- (6) R15 spray cellulose with mesh in building P7
- (7) R17 spray cellulose with mesh in buildings P1, P82, and P85

c. Floor Insulation.

(1) R7 spray cellulose with mesh in building P400

- (2) R11 spray cellulose with mesh in building P102
- d. <u>Weather Stripping</u>. Doors in buildings P62, P81, P82, P83, P84, P85, P102, P442, and S268
- e. Destratification fans in buildings P1, P2, P3, P4, P5, P7, P8, P28, P50, P51, P52, P53, P82, P83, P84, P85, P88, P400, S252, and T459

f. Window Treatment.

- (1) R19 spray cellulose with mesh in buildings P1, P24, P28, P82, P83, P84, P85, and P88
- (2) R14 insulated curtains in buildings P1, P14, P79, P81, P82, P83, P84, P88, P102, P244, P400, P442, T244, and T524
- (3) Storm windows in building P1
- (4) R19 dryvit panels in building T459

g. Lighting Modifications.

- (1) Incandescent to high-pressure sodium in buildings P2, P3, P4, P5, P6, P8, P50, P51, P53, and P88
- (2) Mercury vapor to high-pressure sodium in buildings P82, P83, P84, and P85
- h. The terms dryvit, F/G, and fiberglass are used to describe a type of product. They are not intended to be exclusive of other similar products.
- 3.1.2 SOLAR DHW HEATERS IN FAMILY HOUSING. Work will consist of installation of solar DHW heaters and appropriate plumbing and instrumentation in family housing. In addition, for buildings in the 130, 160, and 180 series, a small weatherproof cover will be constructed to house the new hot water tank.

- 3.1.3 HEATING, VENTILATING, AND AIR-CONDITIONING (HVAC) SYSTEMS MODIFICATIONS.
 - a. <u>Building P1 Section I Commissary: Refrigeration System Heat.</u> This change consists of modifying the freezer refrigeration condenser cooling water system. The water will be piped to a heating coil in the existing air handler in parallel to the existing water cooling tower. A new control circuit with a heating/cooling thermostat will be required to interlock and sequence the air handler with the freezer refrigeration system. The heat that is presently wasted will be reclaimed in the air supplied to heat the buildings.
 - Building P54 Computer Air-Conditioning Units: Liquid Sensible Heat Recovery. This change applies to each of seven computer air-conditioning units that utilize glycol/water as the heat transport medium for the refrigeration condenser. A precooling coil will be installed with piping to connect it in parallel with the existing glycol/water cooled condenser. Controls and valves will be required to allow the coil to augment the cooling provided by the existing refrigerant coil during mild weather. In cold weather, the refrigeration system will be shut down with 100 percent of the computer cooling load handled by the glycol/water cooling coil.

4. INCREMENT B - UTILITIES, DISTRIBUTION SYSTEMS, AND ENERGY MONITORING AND CONTROL SYSTEM (EMCS)

The following measures were studied in some detail during Increment B:

- o Exterior lighting improvements
- o Steam/condensate system improvements
- o Electricity distribution system improvements
- o EMCS expansion

4.1 ECIP PROJECT DEVELOPED

This paragraph describes the only project that resulted from the Increment B portion of the study. The effect of the project is summarized in 10.

4.1.1 MODIFICATIONS OF EMCS. Expand EMCS to include eight additional buildings to control and minimize energy consumption. Useful management data will also be reported to reduce manual requirements and report malfunctions. Buildings affected by this project are P7, P62, P88, P244, P260, P261, P270, and T524.

5. INCREMENT C - RENEWABLE ENERGY SOURCES: SOLAR AND BIOMASS

The feasibility of utilizing solar energy to supplement DHW heating, space heating, and a combination of water and space heating was analyzed during Increment C. No project in either the sample support building or in the sample family housing building proved acceptable under Increment C guidelines.

In the biomass portion of Increment C, the present economic viability of wood chips as a substitute fuel was determined. However, because of the uncertainty of supply and the potential volatility of the price, conversion to biomass as the primary fuel was not recommended. There are no other potential sources of renewable energy at NCAD.

6. INCREMENT D - COGENERATION

Four different steam pressure/temperature situations were analyzed in order to determine the feasibility of electric cogeneration. In each case, a superheater was required and outlet steam conditions had to be equivalent to current heating system supply conditions. In none of the cases was the life cycle cost as low as that of the status quo.

7. INCREMENT E - CENTRAL BOILER PLANT PROJECTS

Since NCAD already has a central boiler plant, this increment concentrated its analysis on conversion to coal and the potential boiler size configuration. As

a result, a five-boiler coal- and wastewood-firing configuration was recommended utilizing the existing steam distribution system.

8. INCREMENT F - FACILITIES ENGINEER CONSERVATION MEASURES

The scope of work specific for Increment F called for analysis of three potential energy conservation projects: resizing oil burner nozzles, rezoning building 1-1, and rezoning buildings 82, 83, 84, and 85. Only a portion of the last project was recommended for implementation; however, mission changes in the interim have eliminated the need to rezone. In building 1-1, the sources of the problems that led to the rezoning idea were uncovered during the field survey and appeared to be correctable without major expense.

9. INCREMENT G - NONQUALIFIED INCREMENTS A AND B PROJECTS

Several projects that were originally considered under Increment A were reanalyzed under this increment. Those projects that are acceptable under Increment G criteria are described in the following paragraph. The effects of the projects are summarized in 10. One additional project, outside air economizers in buildings 1, 54, and 81, was rejected again.

9.1 INCREMENT G PROJECTS DEVELOPED

9.1.1 WEATHERIZATION AND LIGHTING MODIFICATIONS. Work will consist of the following modifications to improve energy conservation:

a. Interior Wall Insulation.

- (1) R7 spray cellulose in building P87
- (2) R9 spray cellulose in building P92
- b. Roof Insulation. R19 interior spray cellulose in buildings P87 and P92

- c. <u>Window Insulation</u>. R19 interior spray cellulose in buildings P87 and P92
- d. Replace fluorescent lighting with high-pressure sodium in building P92
- 9.1.2 INSULATE STEAM LINES TO U=0.1. The project will consist of gaining access to all steam lines and insulating them to a U-factor of 0.1. Sump pumps will be installed in all pits, and manholes will be installed to protect insulation from water damage. Surroundings will be returned to their original state.
- 9.1.3 WEATHERIZATION FOR FAMILY HOUSING. Work will consist of the following modification to improve energy conservation: automatic nighttime setback thermostats in buildings P30, P40, P41, P133-144, P164-171, and P187-197.

10. ENERGY PLAN

In FY 83, NCAD consumed 821,320 MBtu's of energy at a cost of nearly \$4 million. Implementation of all recommended projects except Increment E would reduce this consumption to 681,581 Btu's, which would cost \$3,288,000 at today's prices. Table 12 summarizes the recommended EEAP projects.

10.1 ENERGY USAGE PER SQUARE FOOT

The total area of buildings at NCAD is 3.93 million ft². Warehouses account for 2.47 million of this or 63 percent. On a gross basis, the consumptions in Btu's in FY 83 and after implementation of recommended projects are:

| | FY 83 | Future | Δ |
|---|---|---|--|
| Electricity Fuel Oil No. 2 Fuel Oil No. 6 | 120,770 Btu/ft ² 5,933 Btu/ft ² 82,284 Btu/ft | 101,610 Btu/ft ² 5,498 Btu/ft ² 66,321 Btu/ft | 19,160 Btu/ft ² 435 Btu/ft ² 15,963 Btu/ft |
| | 208,987 Btu/ft ² | 173,429 Btu/ft ² | 35,558 Btu/ft ² |

This represents an overall reduction of over 17 percent in total energy consumption.

Table 12. EEAP Project Summary

| | | 8 | DD 1391 Information | format | ion | | | Energ | Energy Savings | |
|---|-----------|---------|---------------------|-----------|---------|------|---------|---------|----------------|---------|
| | | Project | CME | | | | Gallons | | KWh | Total |
| Project | Increment | Year | \$1,000 | E/C | E/C B/C | P/8 | F0 #2 | F0 #6 | Electricity | MBtu |
